Not illustrated. 1917 Excerpt: . . . the phase of impaired conduction, which we have already recognised, there succeeds a phase of supernormal conduction before normality is finally reached. The time relations of these phenomena in frogs sciatic nerve at 15 C. can be roughly set out as follows: --1 Goldscheider, Ztschr. f. Klin. Med. , xix. p. 180, 1891. Frohlich, Ztschr. f. allg. Physiol. , iii. p. 473, 1904. 3 Adrian and Keith Lucas, Journ. of Physiol. , xlv. p. 80, 1912. Conduction is impossible from 0 to 0.03 sec. after a previous impulse. , , impaired 0.0310-0.15 sec. supernormal -0.15 to 0.1 sec. , , A knowledge of these facts opens to us a whole range of possibilities in the regulation of nervous activity. According as we time impulses in the nervous system to follow one another at a shorter or a longer interval, we can make them less or more capable of being conducted through any regions of decrement which the system may contain. If there is a region of decrement such that a normal impulse just cannot pass, then impulses of moderate frequency may pass it successfully, while impulses of a high frequency may not only fail to pass it, but may by their frequency prevent any other impulses finding their way through. Let us turn now to consider how these possibilities work out in practice. CHAPTER VIII. SUMMATION IN CENTRAL AND PERIPHERAL TISSUES. The work of Setschenow first called attention to the important part played by Summation in...
