The end usually sought is the ability to describe crystals with such detailed accuracy that minor variations between them and other crystals may be detected and shown graphically or embodied in mathematical expressions. This aspect of the subject belongs unquestionably in the realm of pure science. It involves the accurate measurement of angles with delicate instruments requiring careful manipulation, and the results secured are not sought with any idea that they may have practical value. Quite different is the other purpose to which reference has been made, since it is the attainment of the ability to recognize crystal forms and especially systems almost instantly with the use of few if any instruments, and those who seek this knowledge do so wholly because they expect to use it as a tool for identifying minerals. It is of the phase of the subject last mentioned that this book treats, and it is hoped that it will fill the needs of the growing group of educators who realize the great importance of teaching sight recognition of minerals to engineering students or others who study mineralogy merely for its cultural value.
